Changes made to lab:

The main software issue fixed in the notebook was that the model was originally compiled with regression settings, using *mse* as the loss function and *mae* as the metric, even though the task is a multi-class gesture classification problem. Since the model predicts gesture classes using a softmax output, I changed the compile step to use *categorical_crossentropy* for the loss and *accuracy* as the metric. I also updated the downstream training plots so they track *accuracy* and *val_accuracy* instead of *mae* and *val_mae*, and changed the plot labels, title, and y-axis to match the corrected classification metric.
